# Unit 4 Lecture 1: Decision Trees

October 26, 2023

Today, we will be using the rpart package to fit regression and classification trees (and the rpart.plot package to plot them).

First, let's load some libraries:

```
library(rpart) # install.packages("rpart")
library(rpart.plot) # install.packages("rpart.plot")
library(tidyverse)
```

# Regression trees

We will be using the Hitters data from the ISLR2 package. Let's take a look:

```
hitters_data <- read_csv("hitters-data.csv")</pre>
hitters_data
```

```

                                                  10
                                                             1300
                                                                         90
                                                                                     504
## # i 253 more rows
```

## # i 8 more variables: CWalks <dbl>, League <chr>, Division <chr>,

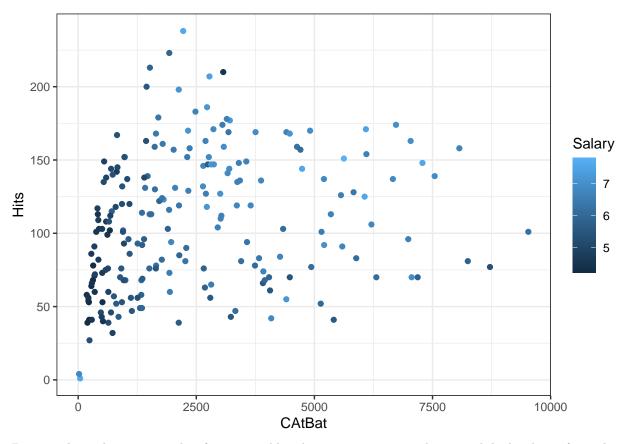

PutOuts <dbl>, Assists <dbl>, Errors <dbl>, Salary <dbl>, NewLeague <chr>

Let's split into train/test as usual:

```
set.seed(1) # set seed for reproducibility
train_samples <- sample(1:nrow(hitters_data), round(0.8 * nrow(hitters_data)))</pre>
hitters train <- hitters data |> filter(row number() %in% train samples)
hitters_test <- hitters_data |> filter(!(row_number() %in% train_samples))
```

Before actually building the tree, let's look at how Salary depends on a couple important predictors: CAtBat and Hits:

```
hitters_train |>
  ggplot(aes(x = CAtBat, y = Hits, colour = Salary)) +
  geom_point()
```

By eye, what split point on what feature would make sense to separate players with high salaries from players with low salaries?

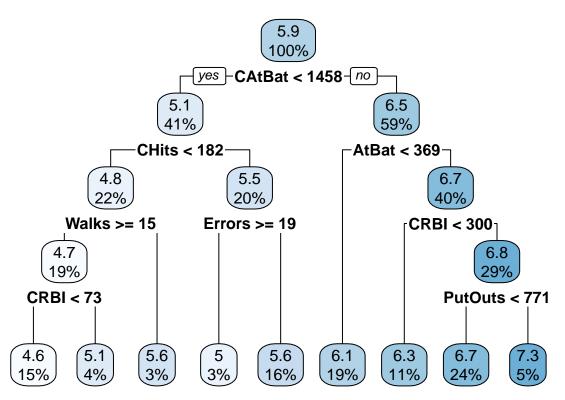

# Fitting and plotting a regression tree

Next, let's actually run the regression tree. The syntax is essentially the same as lm, so we get to use the nice formula notation again:

```
tree_fit <- rpart(Salary ~ ., data = hitters_train)</pre>
```

We can plot the resulting tree using rpart.plot:

```
rpart.plot(tree_fit)
```

Does the first split point match what we predicted above?

We can get a text summary of the tree as follows:

## tree\_fit

```
## n= 210
##
##
  node), split, n, deviance, yval
         * denotes terminal node

## Controlling the complexity of the fit

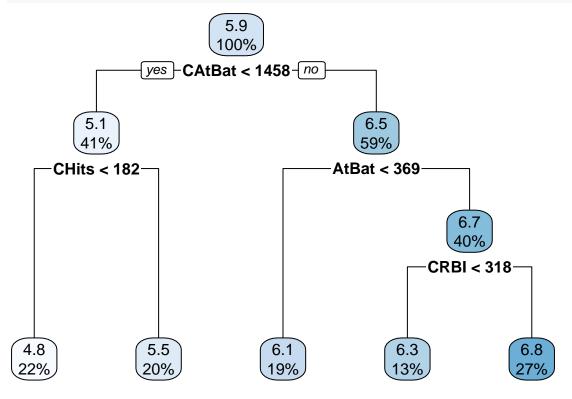

The control argument of rpart can be specified to control how far down the tree is fit. In particular, the default for control is

```
# this code is not meant to be run
control <- rpart.control(minsplit = 20, minbucket = round(minsplit / 3))</pre>
```

Here, minsplit is the minimum number of observations that must exist in a node in order for a split to be attempted, and minbucket is the minimum number of observations in any terminal (i.e. leaf) node. The larger these numbers, the fewer nodes there will be in the tree.

Let's see what happens when we crank minsplit up to 80:

```
tree_fit_2 <- rpart(Salary ~ .,
  control = rpart.control(minsplit = 80),
  data = hitters_train
)
rpart.plot(tree_fit_2)</pre>
```

## Making predictions and evaluating test error

As usual, we evaluate the performance of decision trees based on their test error. We can use the predict function to make predictions on our held-out test set for the two trees fitted above:

```
pred_1 <- predict(tree_fit, newdata = hitters_test)
pred_2 <- predict(tree_fit_2, newdata = hitters_test)
results <- tibble(Y = hitters_test$Salary, Y_hat_1 = pred_1, Y_hat_2 = pred_2)
results</pre>
```

```
## # A tibble: 53 x 3
##
          Y Y_hat_1 Y_hat_2
##
              <dbl>
                       <dbl>
   1 6.21
##
               6.73
                        6.84
##
    2 4.52
               4.57
                        4.81
    3 4.25
               4.57
                        4.81
##
    4 4.32
               5.56
                        4.81
##
##

               6.06
                        6.06
   6 4.61
               4.57
                        4.81
##
    7
       6.66
               7.27
                        6.84
##
##
    8
       6.77
               6.73
                        6.84
                        6.06
##
   9 5.62
               6.06
## 10 6.75
               6.73
                        6.84
## # i 43 more rows
```

We can then extract the RMSE of the two methods using summarise, as usual:

```
results |> summarise(
  RMSE_1 = sqrt(mean((Y - Y_hat_1)^2)),
  RMSE_2 = sqrt(mean((Y - Y_hat_2)^2))
)
```

```
## # A tibble: 1 x 2
## RMSE_1 RMSE_2
## <dbl> <dbl>
## 1 0.598 0.504
```

Which method performs better? Why might this be the case?

## Classification trees

To illustrate classification trees, let's use the Heart data:

```
heart_data <- read_csv("heart-data.csv")
heart_data</pre>
```

```
## # A tibble: 303 x 14

```

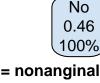

```
## 9 63 1 asymptomatic 130 254 0 2 147 0 1.4 2 ## 10 53 1 asymptomatic 140 203 1 2 155 1 3.1 3 ## # i 293 more rows ## # i 3 more variables: Ca <dbl>, Thal <chr>, AHD <chr>
```

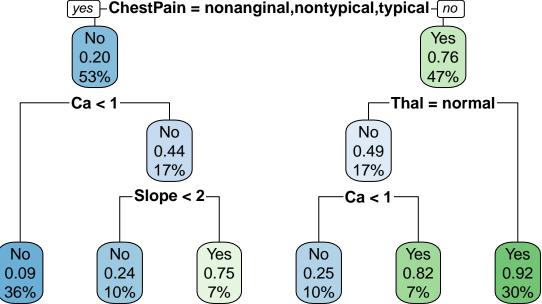

Again, let's split into train and test:

```
set.seed(1) # set seed for reproducibility
train_samples <- sample(1:nrow(heart_data), round(0.8 * nrow(heart_data)))
heart_train <- heart_data %>% filter(row_number() %in% train_samples)
heart_test <- heart_data %>% filter(!(row_number() %in% train_samples))
```

Now, we can fit a classification tree as follows:

```
tree_fit <- rpart(AHD ~ .,
  method = "class", # classification
  parms = list(split = "gini"), # Gini index for splitting
  data = heart_train
)
rpart.plot(tree_fit)</pre>
```

To make predictions, we can use predict as before:

```
pred <- predict(tree_fit, newdata = heart_test)
pred |> head()
```

```
## No Yes
## 1 0.08333333 0.91666667
## 2 0.90909091 0.09090909
## 3 0.17647059 0.82352941
## 4 0.75000000 0.25000000
## 5 0.08333333 0.91666667
```

```
## 6 0.08333333 0.91666667
```

##

Yes 5 20

Note that by default, predict gives fitted probabilities for each class. We can either manually threshold these at 0.5 (or another value), or we can specify type = "class" to get the class predictions directly:

```
pred <- predict(tree_fit, newdata = heart_test, type = "class")</pre>
pred
         2
              3
                           6
                                    8
                                        9
                                           10
                                                        13
                                                                    16 17
                                                                                       20
